

Shopping Cart

Herendira Camarillo, Josue Gonzalez, Edgar Reyes, Rogelio Rodriguez

Description

For our final project we created a shopping cart website. The website is design to promote clothes. Our website uses random clothing appeal. The clothing appeal does not come from a specific brand and does not include a specific size. As a team we analyzed all the pros and cons when we were approaching the whole project. Our website includes a female and a male section to keep everything organized in our database. The main page includes a slide that includes images of people being in fashion. Our login page is simply for keeping track of our inventory. The login page will let you make changes to our database by having it updated or deleted. Login page will also give you options on logging out, adding a new item to database, and printing out a report. When adding a new item, it will ask for a color, type, price, and the image link. The report page will print out average price for male and female and our total inventory of items in our database. The male and female page include the same context when it was coded but not displayed. The pages are hard coded,until a change is made from a featured filter like a color, type or price. Our shopping cart page, shows a quick summary of the products that were added while shopping for items. The page includes a section where the quantity changes, the price updates, an image of the item selected, a description of the item and it small summary of the total cost.

Product & Technical Specifications

- Database access
- Real-time SQL query capabilities
- Report generation and aggregation
- Cross platform support

Dependencies

- SQL services
